<u>ABSTRACT</u>

 A garbage can which has: a) a bottom section; b) a top section; and c) a connecting means for connecting the bottom of the top section to the top of the bottom section. The bottom section has at least one axle; and at least one wheel. The top container defines a slanted bottom corresponding in shape to the slanted top of the bottom section so when separated the two sections defines a slanted opening. The slanted opening is at an angle less than 90 degrees from the back of the container. The axle tube has a first position and a second position along the container bottom. The first position and second position releasably hold the axle when the axle is in place. The bottom has a handle adjustable relative to the back of bottom section. The top section has a removable cover. The top section has a bag grip to hold a bag over the opening when the removable cover is removed.
